Composition in Animal Grouping	128

## TIPS ON DRAWING ANIMALS

It is well to divide the body into three parts — forequarters, belly, and rear quarters. Since this is a natural division, it aids in achieving proper proportion. Draw in dorsal stripe (line of vertebrae). This helps to center the animal.

Bears have a tendency to be pigeon-toed. The paws of the cat family spread out slightly.

Always indicate skeleton bones; these will hold the sketch together. Once you are familiar with the relative size of the various bones, drawing becomes easier.

Most hoofed animals are slightly knock-kneed — more so when they're young.

Divide the skull into three parts also: the muzzle, the long part of the nose, and the base of the skull.

Fasten ears onto the back of the head. For simplicity, indicate the base with an oval.

Divide the head in the middle for construction; it's a natural division.

Line up the eye with the ears and nostrils; this is a good guide and is correct for most animals.

Bear in mind that the eyes are usually on the side of the head. Draw your guide lines when constructing. With bears, cats, and dogs, the eyes are more forward.

When drawing animals, try to get variety in leg positions. Note the added interest in a sketch when the legs are placed at different angles, in contrast with the stiff, stilted pose with the legs parallel.

It is well to keep these box forms in mind when working with angle shots. If in doubt about a pose, rough in your box lightly, and check your perspective.

## SIMPLIFIED SKELETONS

Before concentrating on individual animals, it is helpful to note some facts concerning the skeleton in general.

Once you have acquired some knowledge of the pivot points or joints in a skeleton, your drawing will come more easily.

Legs are very pliable, capable of doubling up and stretching out.

On the leap pose below, note how the rib cage elongates in a stretched position.

## SKETCHING IN FORMS

Once you have the basic principles of the skeleton in mind, you may proceed with more assurance in your drawing. In sketching, it is helpful to indicate the positions, or pivot points, on the sketch. After locating these, draw the main forms of your animal.

A diagram such as the one above will prove helpful when you have forms behind one another. Keep this in mind when drawing any animal in this position.

## MOOD AND FEELING

Every artist is an actor, in that he conveys to the observer the mood or attitude of his animal characters and must feel the situation before he can put it down on paper. If the mood is a tense one, such as that of the deer group, then you strive for a taut, tense mood in your characters. At such a time, animals drop lower on their hindquarters, prepared for a quick departure if the situation warrants. The ears and tail are perked up. The whites of the eyes are seldom visible in animals except when they are extremely tense and frightened. In the deer sketch, the stretched necks also help to convey tension.

In a very tired pose, like that of the horse, the effect requires as much droop as possible. Animals shift their weight from leg to leg when tired. Their heads hang low. Keeping the withers high accents that effect.

To convey excitement, flaring the manes of the horses was helpful. The nostrils are wide, ears back, and the whites of the eyes visible. The neck muscles are taut.

The best way to stage the cowering pose for the dogs seemed to be to keep the heads low, with their attention drawn up. The rear quarters are dropped, and the tails are between the legs.

The lions below express a mood of lazy contentment. Like their domestic cousins, lions lazily swish their tails in relaxed moods such as these. The head of the farther animal resting on the other cat's back gives the scene a quiet peace.

Whatever the mood, see it mentally before you start to work. It may be necessary to sketch several rough poses before you find one which you feel is satisfactory. The following are good test questions to ask yourself: Will this pose convey the meaning in silhouette? Is my staging clear? How can I make this pose stronger?

## THE USE OF LINE

Basically there are two kinds of line: a straight line, and a curved line of varying degree. Primarily we use line to build form and solids and to create movement.

Fig. 1

Fig. 2

Fig. 3

Fig. 4

Fig. 5

Here are some basic lines used to build forms and solids.

An example of Fig. 1 is the cat. Note heavy lines in these examples.

Fig. 2

Fig. 3

Fig. 3 is a good one also to create weight in horizontal view.

Fig. 4

Fig. 5

The next use of line is to create motion.

With this arc two directions of movement have been started.

To build further, use the straight line, which relieves the monotony of all curves.

Repetition of line is also very good, since it furnishes a necessary contrast to opposition. Note bear's right rear leg and the line of the stomach.

To create more movement, reverse the arc.

In this step, note how the stomach line opposes the leg line. Opposition is always good because it is a part of good composition. Work forces against forces.

Remember your horizontals, verticals, and diagonals. Every picture should have them.

For rhythm and sweep in your drawings always establish a line of action. Some of the accepted lines are these.

Basically the line of action is the flow of a graceful line.

The neck and tail are excellent for establishing this flow; either can be used in different ways. In these two poses, both are part of the line of action.

In this case the tail is used as an accent. Note leg leading into line of action.

Accents are good, for they relieve the sameness of flow of action — like a touch of red on an all-green background.

## Exaggeration

Get the full use of your pose, whatever it may be. If a horse is taking off in a leap, really stretch its legs; throw the head and body into the take-off. Here is another example of stretch.

## Weight

In the sketch below, note the changing leg actions and the stretching of legs reaching for the ground. Observe in the middle drawing how the right leg reacts to the weight of the body. Note that the left leg is still stretched, and doesn't receive the weight of the body until the next pose. Note how right leg and neck are thrown forward for the next leap.

## ACTION ANALYSIS — ANIMATION

Feel weight, stress and strain, action and reaction.

Arrows indicate the flow of action.

Arcs are important in animation. There is always a pivot point, but even that pivot point is movable, as below.

Overlapping action is another important factor in animation, where parts of the body take different paths of action. Note legs.

The use of reverse action is good practice.

Note the bunching up and elongating of forms, as in a rabbit taking off.

## ACTION ANALYSIS — IMPACT

Like a rubber ball which elongates in falling and squashes on impact, so a living body will react in comparable circumstances. In his descent, the horse has thrown his head back, his stretched forelegs are reaching to prepare for the impact, and his body elongates in his fall. The legs are first to react, taking his weight at the first shock of his fall. His head pulls downward, and his whole body reverses as he starts his fall. The ball on the rebound elongates again, although not as much as in the original fall, since it has lost some of its momentum. Similarly, the horse in this case regains more of his normal shape as he slows down in the fall.

## BRUSH TECHNIQUE

Brush and ink is an excellent medium for drawing animals. Since the fur textures of animals vary, your brush technique will vary also. To show the high sheen of a race horse, for example, I keep my brush stroke thin, close together, and even, leaving open areas to suggest high lights.

Shagginess, which is a characteristic of some comets, dogs, etc., may be conveyed by a dry-brush style. This is obtained by thinning out your brush on scratch paper after

you have dipped it in ink. The desire here is to have the tip of the brush flat, with the thin edges of the hairs of the brush just wet enough to give a soft tone. The wetness of the brush and the pressure of the brush on the paper determine the tone value you will achieve.

Regardless of the technique, I always hold my brush as I would a pencil, using wrist action for my brush strokes.

Here are some practice exercises for the two styles described.

## THE HORSE FAMILY — Bone Structure

Without knowledge of the principles of bone structure, it would be difficult to show construction, animation, or caricature. Naturally the skeleton varies with the conformation of each type of animal, but there is a basic similarity in the skeletons of all animals. Here is a simplified approach for the skeleton of a horse.

Starting with the spinal column, treat it, for the sake of simplicity, like a rubber hose, tapering down to a point at the tail end.

Next add the vertebrae, simplified again. Note variety in shape. The two high points are support for leg bones.

View showing shape of skull.

Build on the rib cage (here the rib details are omitted).

Now attach skull.

Next attach the scapula. Arrow points to socket for humerus bone.

Add humerus, elbow, and foreleg.

Finished leg.

For sketching purposes, you can think of it as simply as this.

The scapula fits around the contour of the rib cage.

Next step: add the back plate for rear legs. Note sockets for legs.

Perspective view of back plate and socket.

Bone fits into socket.

With the building downward of the rear leg, the skeleton is completed.

Finished sketches of bone structure

Study each skeleton with the related drawing. Observe how flanks turn out and knees turn in on hindquarters — also slight knock-knee in standing pose.

## MUSCLE STRUCTURE

Note underlayer of muscles leading to head. It would be a good exercise to draw in the skeleton over this drawing since it would show clearly where the muscles wrap around various bones.

## VARIOUS PARTS

Thinking of the horse in separate units will help you to visualize the animal as a solid, and to see the relative size of various parts.

Note the position of the scapula.

Neck fits into head.

Fit the stomach under.

Parts put together from a side angle.

## HEADS

There is no easy way to block in a horse's head, since there are so many planes to consider. Once you are familiar with the skull, the job will be relatively simple, especially since much of the bone structure of the head is very pronounced.

Thinking of the head in two sections may help you. In the lower right-hand sketch, note how both the neck muscle and the bone behind the eye follow around the ear.

A common mistake of beginners is to place the eye of the horse too far forward. When roughing in the head, check the divisions to be sure it is in proper perspective.

# MUSCLE ACTION

Like a taut rubber band, the muscles elongate in stretched positions. In crouched positions, as in the first sketch, the muscles bunch up.

When the horse pushes off with his forefeet, not only do the legs stretch out, but the whole forequarter section as well. The neck becomes longer, with a lot of tension on the under muscles connecting to his head.

Always think of the elasticity of form.  
Even the rib cage is pliable for squareness and elongation.

Tendons also play an important part.

There are points to remember in drawing action poses, some of which have been mentioned before but are worth repeating. They are:

Stress and strain

Elongating and bunching of form

Weight

Action and reaction

Weight reaction, as in the impact from a high fall.

Boxing in, as shown here, is a good guide in keeping your figures in perspective. Without it, it's very easy to miss.

Arcs in perspective, as shown below, are worth putting in once you've determined the perspective of your figure. Your eye is a pretty good judge.

## ANIMATION—JUMP

Note how head and body lean into push-off.

Kick

Animated step in perspective.

As a practice exercise, give yourself a problem such as a horse pulling a heavy load forward. Get as much drive in the pose as possible. Then reverse your pose by having the horse pull against the load, backwards.

# TROT

A horse in a trotting gait.  
Trotting is a two-beat gait with a ground  
contact from the hind legs and the fore

Right rear leg and left foreleg pushing off, right foreleg taking weight.

Note dip of rear as legs pull through, right foreleg pulling body.

Rear legs gather under for cantact.

Rear legs again take weight.

Back to beginning of cycle

## ROUGHING IN

Work for twists in the body as much as possible in action poses. Strive for variety in the leg action and reversal of forms.

Let your brush or pencil glide over the paper feeling the rhythm of the motion; forget detail; keep building.

At right, two stages of roughing in.

"Feel" your drawings! Give plenty of punch to the stretched legs, and put tension in the pulls on muscles.

See your pase mentally before rough-  
ing it in.

## DRAFT HORSES

These boxed-in drawings show the difference in size and conformation between the draft and saddle types of horse.

The draft horse is massive in neck and shoulders. For show purposes, the legs are feathered out.

Note width of rear.

## COLTS

Colts are very long-legged in proportion to the body. Note boxed-in figures for comparison. In drawing colts, keep in mind large joints on legs, small hoofs, slightly larger ears, short tail and mane, small muzzle, and slight dome of head.

Because he is young, there is an awkward legginess to a colt's actions, as though he is never quite sure of his balance. Try to capture that feeling in your poses.

Approach: getting the attitude or pose and placing pivot points.

Feeling form — solidifying drawing.

Working in the detail of the forms.

## BLOCKING IN

When you have your horses sketched in and you desire tone, block in your planes. Concentrate on basic planes first, and then work to the minor ones. When doing this, sketch in your lines following the contours of the body. If the basic planes are right, the lesser ones will not be difficult.

## ZEBRAS

The zebra is a beautiful animal because of its design and markings.

Note that the hind end is higher in proportion than that of the horse.

Characteristics of the zebra are large, round ears, short head, and, as a rule, smaller hoofs than the horse.

The drawing below was done purposely without outside construction lines, to show how the stripes follow the form of the animal.

Note larger stripes on rear.

# HORSES and ZEBRAS — CARICATURE

On the draft horse, exaggerate chest and try to keep an all-around short stoutness.

To me, the zebra suggests cuteness and decorativeness. The points of exaggeration are: large ears, small muzzle, short body, large rear, rather small, tapering legs, and small feet. The end of the tail is full and bushy.

Note how small knees accent the fullness of feathering of the legs.

To suggest tall, sleek, aristocratic thoroughbred, all proportions have been kept slim and tapering.

Note flare given to tail for a peacock-like impression.

For a comic effect, I have used a  
awayback, thin neck, large head, and  
knock-knees with large hoofs.

On the colt, I exaggerated the length  
of the legs, the shortness of the body,  
and the high crown and small muzzle.

The teeth have it in this one. Horses'  
teeth do protrude at nearly a 45°  
angle.

The Trojan mane accents the thick neck  
of the draft horse. I slenderized his legs  
to accentuate the fullness of the hoofs.

## THE DEER FAMILY

The deer is slender, graceful, and angular in body. Work for tapering forms. The bone structure is very prominent in the legs.

Don't forget the three divisions of the body!

The leg is very thin between tendon and leg bone.

## Walk

Deer lift their feet high at the beginning of each step - note arcs.

## Jump

Note the low arc the rear takes. Observe also how neck and head are back in drawing where the deer is landing, and then how it throws them forward in take-off.

Virginia deer, found in the northern and eastern United States, are excellent for drawing. They are tall, lean, and extremely graceful in motion.

Work for rhythm — their bodies are full of it.

Slow-motion pictures reveal some very extreme positions, like the one above.

## STAGS

The bone structure of the stag is naturally heavier than that of the doe. Its neck is thicker, the muscles are more pronounced, and it is broader generally throughout the body.

The antlers vary in size and number of prongs, in accordance with the age and type of deer. They furnish a nice decorative accent to the drawing.

A few lines can suggest many forms.

It is helpful to have a strong line of action, leading from the rear leg to the head.

## FAWNS

Fawns are very delicate in their bone structure. They are quite knock-kneed at an early age. Like most young animals, they have a high forehead.

## DEER — CARICATURE

Keep clean, sweeping lines, tapering body. In the adult, the arched neck contributes to the feeling of grace. For the fawn, emphasize the short body and long legs. Note how the crown is suggested.

To give the stag an air of stateliness, broaden the chest and neck, and add a lot of flare to the antlers.

## THE CAT FAMILY

Generally, all cats are long and narrow in body, with long, tapering legs. The neck always appears to blend into the body in one graceful line.

To get rhythm in your cots, work for flow of line and tapering forms.

Note the shortness of the lower part of the hind leg in comparison with the length of the upper section. It is this characteristic which gives cats their spring in leaps.

The jaw is broad. Observe the parallel between the common domestic cat and the wild puma type.

For the feeling of rhythm, weave your forms together. It not only unifies your drawing but gives it movement and grace as well.

Note accents for connecting forms.

Particularly on the lion, the upper lid overhangs quite far, making a good visor for the eye.

Puma

Difference between noses:

Baby puma, spotted when young.

Lion

Tiger

# LIONESS

The lioness is less broad than the male and looks more graceful.

### Head of Lioness

If the groundwork is right, the drawing will be solid.

### Lion Cub

Cute and kitten-like in appearance, the lion cub is always fun. Note how body is broken up into three parts: the shoulders and forefeet, the body, the hindquarters.

## LION

The mane tapers back over the withers. On an adult lion, it also grows some distance back on the underside.

Because he is heavy and solid, the lion appears to be shorter-bodied than most cats.

# LION JUMP

Body ready for leap. Note how hindquarters gather beneath him, ready to push off. Forelegs are pushing off.

Observe the shifting of hindquarters as animal digs in for jump.

Body in push-off. Note strong line of action through the whole body. Forequarters draw close to body in forward thrust.

Forelegs arch up, preparing to land.

Right foreleg takes weight in landing. Left foreleg stretches for ground. Hindquarters pull through from stretch position.

Right hind leg stretches in landing. This pose would lead into a pose similar to number one if the cat were to jump again.

## BUILDING A HEAD

Work for broad planes at first. See that your forms relate to each other. Dividing the head down the middle will help, since it will give you a line of comparison by which to keep your forms in proper perspective.

The lines are shaded in, following the contours of the forms.

## TIGER

The tiger is long in body, with a sturdy back. He has beautiful, tapering lines, and is pleasant to watch because of his gracefulness.

To put in stripes, I use a wet brush, varying the pressure to produce both thick and thin lines.

DOMESTIC CATS

# KITTENS

As in all baby animals, the body is short, the forehead large.

## CATS — CARICATURE

I like to emphasize the sleekness and rhythm of the black panther — the long, tapering legs and long body.

The open mouth of the left gives a comic effect. In this sketch, I made the mouth broad at the top and narrow at the bottom to give variety of shape, and to emphasize the open, stretched position.

In the comic type above, I emphasized the size of his head, mane, and chest region. The chin whiskers are exaggerated, and the tip of the tail is full to obtain a flare effect.

Nature built the cow to carry a heavy load. Note prominent spinal column. Bone structure is very prominent throughout the body.

## COWS—CARICATURE

They're very angular, with protruding bone areas and a great deal of bulk in the stomach. The basket-like drawing at the top suggests the manner in which the weight hangs from the spinal column.

Making the tip of the tail full gives a nice accent.

The emphasis here is on the jowls. By contrast, the small muzzle points up the effect.

## BULLS

The neck and shoulders are thick and solid. There is a good deal of loose skin hanging on the under part of the neck.

## BULLS — CARICATURE

Here I have emphasized the neck and forequarter section and dwarfed the size of the legs to give more bulk to the body. The length of the horns is exaggerated, and the tip of the tail is made very full to serve as an accent.

For an incongruous effect, I have used very thin legs on the characters below.

## GIRAFFES

The giraffe is very angular animal, with a wide jaw and a pointed, V-shaped nose. The upper lip is split, and the eyes protrude somewhat from the side of the head. The hindquarter section is set low, in contrast to the high withers.

Baby giraffe.

## GIRAFFE—CARICATURE

### Points of exaggeration:

- Spread horns
- Long neck
- Very angular
- Knock-knees
- Split lip
- Very high at the shoulder
- Very low in rear
- Flared tail
- Long split hoof

## CAMELS

A camel has many dominant characteristics. He is a very leggy animal with a deep chest. To me, his most unusual feature is the very small area on which the hindquarters are set. Unlike most animals, the angle of the eye is different from that of the mouth. The eyes are wide-set, and protrude from the head, somewhat like those of the giraffe.

The hump is a fatty substance and is not attached to the backbone.

## CAMELS — CARICATURE

Being caricatures in themselves, camels are comparatively easy. I emphasize the following points: very small pelvic region where hind legs attach to body, long lower lip, hump (accentuated by making it wider at top.)

# GORILLAS

Simplified skeleton.

Short thumbs.

Wide separation of toes.

Massive and barrel-like body.

The cheekbones are very pronounced,  
the eyes deep and inset, the nostrils  
wide, and the forehead low.

## GORILLAS — CARICATURE

For the comic type, I have exaggerated the size of the chest and arms, in relation to the small legs. The points which I believe give this drawing a silly appearance are: the long upper lip, broad mouth, small pointed crown, and long arms in contrast to short legs.

To convey the feeling of formidable power to this "menace" type, I have exaggerated his powerful shoulders and arms. The head is buried right in the body, and the size of the mouth is exaggerated. The small crown helps to accentuate, by contrast, the massiveness of the body.

## PIGS

In spite of their fullness, don't go too round on their forms. The sketch below shows how fat hangs over the body.

The piglet's high forehead gives him cuteness. Keep the body relatively short.

Note the breaks on the back. I use this division for all animals.

## WART HOGS

The bone structure is very similar to that of its domestic cousin. The nose is longer; the ears are more erect, and do not hang like the domestic pig's.

There is hair running from the forehead almost to the middle of the back.

From the back the wart hog closely resembles the common pig.

## PIGS — CARICATURE

Jawls and all-around beefiness are good points of exaggeration, as well as small eyes and heavy, floppy ears. On the dawager type above, the top of the head is small so that the curls will have more flare. On the pig below the narrow shoulders emphasize, by contrast, the size of the stomach.

In "menace" wart hag type, note volume of chest and how head is buried right in the chest.

In caricature, make use of contrasting types as much as possible. Contrast establishes types more definitely.

## DOGS

Dogs vary in conformation and size, but are closely alike in many respects. Below are two simplified skeletons for two different types. They are kept the same except for relative size of parts of the skeletons. Keep in mind the character of the dog—for example, the long back and short legs of a dachshund contrasted with the relative short squareness of an English bull.

# DACHSHUND

## ENGLISH BULL

The English bulldog is broad of chest, with a flat nose and over-all blunt features.

Note the bowlegs.

## GREYHOUND

in the greyhound and whippet breeds,  
the bone structure is very pronounced.  
They are extremely flexible in body.

COCKER

# GREAT DANE

Stripped of his long hair, a collie is lean. Work for long sweeping lines when sketching in.

Dogs are marvelous for caricature because of the many contrasting types. When you have several together, work for opposite types. This will make each one stand out more definitely.

## Dachshund

Exaggerated length of body, long pointed head, and length of ears.

## Bloodhound

Exaggerated angular body, size of nose, and loose skin on the head. The ears are long to give a heavy effect.

## Bulldog

Exaggerated heaviness of chest, short, stocky bowlegs, and massive jaw. The spiked collar helps in this case to establish the character of the dog.

## Sheep Dog

Exaggerated wooliness. The tail was flared far accent.

Some of the salient characteristics are, a small, pointed muzzle and nose, slanted eyes, large pointed ears, and small feet.

Baby fox.

## FOX—CARICATURE

The fox is very flexible to handle. Here I have illustrated both the more conventional and the humanized types.

In the above sketch points of exaggeration are: small, pointed nose, slender legs, small feet, pointed ears, slanted eyes, and full tail.

For cuteness I emphasize the large head with the eyes set low, giving more forehead. The body is short and small, thus further exaggerating the size of the head.

The rib cage is small, and the forelegs hang, rodent-like. Head and ears are similar to those of the deer. The tail is long and pointed and quite full at the base where it is attached to the body. The tail is very important to kangaroos, since they use it as a rudder and to help support their weight. Because of its prominence, it will give you a strong line of action, and add sweep to your drawing.

Most of the bulk of the kangaroo is carried in his strong hindquarters.

Kangaroo in Jump

In the second sketch, note that the head is thrust forward, making a long line through the entire body for the push-off. Note also how the body reverses in the fourth sketch as he lands.

Note parallel in hind-leg action of deer and kangaroo.

## KANGAROOS—CARICATURE

Points of exaggeration: square nose, large full ears, thin neck. (Use this for contrast with the very large hind-quarters.)

Make markings dark on all ends: end of tail, paws, feet, and tips of ears.

## RABBITS

Their bodies are very elastic, and they double their length in stretched-out positions.

In the lower sketch, note the three basic units—head, chest, and the lower part of body.

In sitting positions, you'll notice generally that there's a bunching up of forms. But studying motion-picture frames reveals that they are capable of really spreading out.

When spotting your darks, play your lights against the darks.

Bunnies are always fun to draw. It is well to use a dry brush for softness.

#### Jump

Note the bunching up and elongating of the rabbit on the take-off.

Rabbits are excellent for humanized types, their heads and bodies are so flexible for expression. It is especially interesting to work with their jaws and muzzles. The buckteeth add to the comic effect, and their ears can be used in various ways for expression. Hang the ears far sadness; stretch them back in a surprise take, etc.

## SQUIRRELS

### Squirrels – Caricature

For cuteness, keep round and full.

# ELEPHANTS

Work for big, sweeping forms. The elephant is a very angular animal in spite of its tremendous bulk. There is a very prominent vertebral column on the back.

For simple, basic forms, note the sketch at the right.

On underside of trunk, note flatness and how it is divided. Refer to skeleton drawing—it will explain the hollow cheek.

The approach: the main forms are rounded in.

The lesser forms are added.

Finish off.

Just because elephants are big and bulky, don't be afraid to move them around. On action drawings below, note how the hind legs and trunk are used for the line of action.

To make this pose interesting, I opposed the position of the head to that of the line of movement of the body. Note pull of loose skin between head and chest in the drawing at lower left.

## ELEPHANTS—CARICATURE

An elephant has so many unusual characteristics that he is easy to caricature. To create comic effects, I used two completely different types as examples. The upper drawing is incongruous because of the use of long legs and large feet. In the lower drawing, the emphasis is on the huge body and long trunk. A number of other points could be emphasized, such as the size of the ears—or the features could be made to stand out by dwarfing the size of the body.

Various shapes for various types.

## THE BEAR FAMILY

Bears are fun to draw, since their forms are so simple and compact. Work with as many straight lines as possible when drawing them—the tendency is to use too many curves.

Remember the three body breaks; note bear below.

Build on your outer forms when you start, and follow through on the line of action as below, from the rear leg to front leg.

On these quick sketches, note how forms follow through.

Far standing positions, think of the three units which I have indicated below. The high point of the withers breaks the flow of form between the neck and the back.

Observe the use of diagonal and curved lines in this sketch.

The brown bear is broad and massive.

Japanese bear.

# CUBS

Cubs are small in muzzle and high in crown, which gives them a high forehead. Their bodies are short, and they are slightly pigeon-toed like their parents. Keeping the eyes low in their heads adds to the effect of cuteness.

## POLAR BEARS

Polar bears differ from others in that their necks are longer and their noses more pointed. They carry quite a bit of loose hair on the underside, running from the jaw back along the neck, chest, and stomach.

## BEARS — CARICATURE

On the adult, exaggerate the large torso and massive "arms." By keeping legs short, you accentuate size of body.

The use of heavy jowls works nicely on bears. For a silly effect, leave out the chin on your character.

For cuteness in small bears keep the body short and dumpy, the forehead high, eyes low, cheek and stomach full, and the mouth short and small.

For the comic types, I have used two extremes. In one sketch, the main mass is carried in the lower area, while in the other, it is carried in the chest area. In the upper sketch, the thin neck contrasts absurdly with the bulk of the body.

The polar bear seems to lend itself to a stylized drawing. Here, I exaggerated the long neck, pointed nose, and heavy, long forelegs.

# COMPOSITION IN ANIMAL GROUPING

Composition may be an old story to many readers, but for the benefit of those to whom it is new, I should like to summarize some fundamental points. A good picture should be an effective combination of vertical, horizontal, and diagonal lines. There should be opposition, such as a vertical opposing a horizontal line, and repetition, where a line moving in a

certain direction is repeated in another part of the picture. Except in abstract compositions, the use of curved lines is natural throughout the picture. It is advisable too, to have a definite line of action in your picture so that the viewer can follow the movement. An accent is always important, since it tends to break the monotony of a line of action.

The problem in this elephant picture was how to stage it most effectively. Believing that an underneath shot would give the desired dramatic effect, I first concerned myself with a satisfactory pose, in which the observer would be looking up. Then I worked out the rest of the picture so as to intensify that effect. Note the lines of composition. The girl's hair is used as an accent.

To show the powerful bulk of these draft horses, I used a three-quarter front perspective. For dramatic effect, the camera angle is low, thus accentuating the size of the forequarters and the height of the withers of the horse in the foreground.

The grooves in the earth give movement to the picture. The grooves, running downhill in the foreground create contrast with the up-angle of the foreground horse.

The arrows indicate the paths of action.  
The panther's head in the background  
is used as the accent.

In this layout, the use of diagonal, vertical, and horizontal lines is emphasized. A strong vertical, such as the left foreleg of the horse in the foreground, tends to hold the picture together. Note how it leads into the three heads. The rear horse's head is the accent. Observe the right foreleg of the horse in the lead. It furnishes a good diagonal to the picture, as well as extending in the direction of the rear horse's head. (See arrows in sketch.)

in this action drawing, the buck's action is carried from the doe's right rear leg through the buck's left foreleg. To direct attention to the fawn, the mother's head is turned to it, and the fawn is placed in another line of action. Observe the use of diagonals and verticals, and the repetition of both.

Again in this drawing, the various paths of action are indicated by arrows. A strong line of action from the right hind leg of the rear horse follows through to the left foreleg of the front horse. Here, the rear horse's head works as an accent. The angle of the front horse's head is in opposition to the line of his left foreleg. The left foreleg of the rear horse gives a vertical line to the picture.
